Additional Remark	<ol style="list-style-type: none"> In the power supply circuit, it is recommended that the customer should install an over-under-voltage protection and surge protection device to ensure the safety of using electricity. The PC cover, shell, end caps used together with the LED driver inside the LED lamp must meet the UL94V-0 fire rating level or above. As an accessory, the LED driver is not the only factor determining the EMC performance of the LED light fixture. The structure and the wire routing of the light fixture are also relevant. Thus we strongly recommend the manufacturer of the finished LED light fixture re-confirm the EMC of the LED light fixture. 	

3. Product Referenced Lifetime Curve

The curve below illustrates the driver's lifetime data when the LED driver's Max. case temperature reaches 40°C, 50°C, 60°C, 70°C and 80°C.

6. Dimmable Feature (The test data below are for your reference only.)

1) DIP Switch (Take 800mA as an example. When the 4 switches are “OFF”, the output current is 800mA/100%.)

DIP Switch Form (50mA/gear)					
TA	Current	1	2	3	4
50 ° C	600mA	-	-	-	ON
	650mA	-	-	ON	-
	700mA	-	ON	-	-
	750mA	ON	-	-	-
	800mA	-	-	-	-

2) 3 dimming modes in one driver.

I. 0-10V dimmable: dimming range 10%~100%. (Tested with LIFUD 0-10V dimmer.)

Voltage signal	0V	0.5V	1V	2V	3V	4V	5V	6V	7V	8V	9V	10V	OPEN
Iout percentage	OFF	ON	8%	18%	29%	40%	51%	62%	73%	84%	95%	100%	95%-105%

II. PWM dimmable: dimming range 10%~100%. The voltage amplitude is 10V and the frequency of PWM signal is 300Hz~3KHz. (Tested with PWM signal generator: RIGOL.)

PWM signal	0-5%	6%	10%	20%	30%	40%	50%	60%	70%	80%	90%	100%	OPEN
Iout percentage	OFF	ON	10%	24%	36%	48%	59%	70%	80%	88%	96%	100%	95%-105%

III. Resistor dimming: dimming range 10%~100%. The resistance range: 10kΩ~100kΩ. (Tested with LEVITON.)

Resistance	0-5K	6K	10K	20K	30K	40K	50K	60K	70K	80K	90K	100K	OPEN
Iout percentage	OFF	ON	15%	27%	38%	49%	60%	71%	82%	94%	99%	99%	95%-105%

Remark: The “Iout percentage” above are typical values.

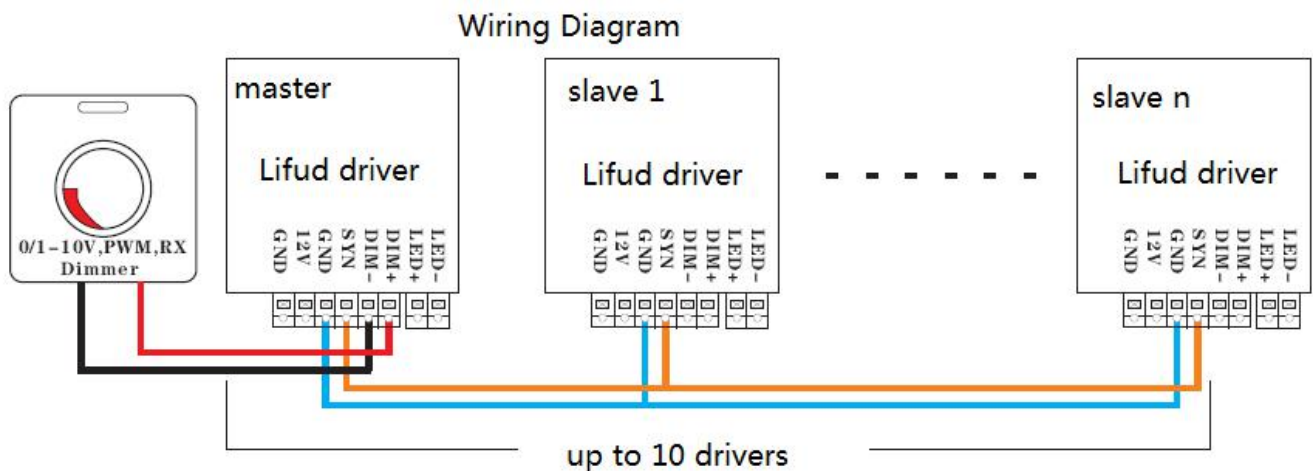

7. SYNC Dim Instruction

Up to 10 drivers can be connected and dimmed synchronously, as long as the wire between each two drivers is within 20 meters.

Q: How to connect these 10 drivers?

A: (The wiring diagram is shown as below.) The DIM+ and DIM- terminals of the driver are connected to the dimmer and this LED driver is as a master. Connect the GND terminal (in the middle, not the lateral one) of the “master” driver with the GND terminal (in the middle, not the lateral one) of the 1st “slave” driver. Connect the GND terminal (in the middle, not the lateral one) of the 1st slave driver with the GND terminal (in the middle, not the lateral one) of the 2nd slave driver and so on. Connect the SYN terminal of the “master” driver with the SYN terminal of the 1st “slave” driver. Connect the SYN terminal of the 1st slave driver with the SYN terminal of the 2nd slave driver, and so on.

Dimming signals include: PWM/0-10V/Resistance signals.

--------------	-------------	---------------	--

Remarks:

- 1) The “master” driver is the one connected with dimmer (sending out the dimming signal). It can be automatically recognized by the IC of the LED driver.
- 2) The dimming wires (around 22AWG) between each driver must not exceed 20 meters.
- 3) NEVER WIRE LED LIGHT FIXTURES WITH LIVE CONDUCTORS. Switch off the power first and make wire connection. Make sure the connection is correct before powering up the LED light because wrong connection will lead to damage of the LED driver or dimmer.
